

Chapter 1 Economic Freedom of the World in 2013

Nearly three decades have now passed since Milton and Rose Friedman joined Michael Walker and the Fraser Institute as the hosts of the initial conference designed to define and develop a measure of economic freedom. Six conferences focusing on this issue were held between 1986 and 1994. The index published in *Economic Freedom of the World* (EFW) was an outgrowth of this series of conferences. Approximately 60 scholars assisted with the development of the index, and dozens of others have contributed following the 1996 publication of the *Economic Freedom of the World: 1975–1995* and the establishment of the Economic Freedom Network (Gwartney, Lawson, and Block, 1996).

During the two decades following the initial EFW report, academic interest in the impact of economic and political institutions on the performance of economies grew rapidly. There was a virtual explosion of scholarly literature in this area that is now known as the New Institutional Economics. We are delighted that the EFW measure has been widely used by scholars seeking to identify how economic institutions, along with other factors, influence various indicators of performance and quality of life.

As work was going forward on the EFW project, Milton Friedman often reminded participants that our goal was to develop an accurate measure of economic freedom that would move the discussion from emotionally charged statements to scholarly research. At least to a modest degree, this has been the case. The EFW data have been used in nearly 500 scholarly articles to address a wide variety of issues. We are particularly proud of the fact that it has played a role in shifting the focus of scholarly research from subjective statements about what people think toward objective research examining the impact of economic freedom and other factors on various economic indicators.

The concept of economic freedom

The cornerstones of economic freedom are (1) personal choice, (2) voluntary exchange coordinated by markets, (3) freedom to enter and compete in markets, and (4) protection of persons and their property from aggression by others. Economic freedom is present when individuals are permitted to choose for themselves and engage in voluntary transactions as long as they do not harm the person or property of others. Individuals have a right to their own time, talents, and resources, but they do not have a right to take things from others or demand

that others provide things for them. The use of violence, theft, fraud, and physical invasions are not permissible in an economically free society, but otherwise, individuals are free to choose, trade, and cooperate with others, and compete as they see fit.

In an economically free society, the primary role of government is to protect individuals and their property from aggression by others. The EFW index is designed to measure the extent to which the institutions and policies of a nation are consistent with this protective function. Put another way, the EFW measure is an effort to identify how closely the institutions and policies of a country correspond with a limited government ideal, where the government protects property rights and arranges for the provision of a limited set of “public goods” such as national defense and access to money of sound value, but little beyond these core functions. In order to receive a high EFW rating, a country must provide secure protection of privately owned property, even-handed enforcement of contracts, and a stable monetary environment. It also must keep taxes low, refrain from creating barriers to both domestic and international trade, and rely more fully on markets rather than government spending and regulation to allocate goods and resources. In many ways, a country’s EFW summary rating is a measure of how closely its institutions and policies compare with the idealized structure implied by standard textbook analysis of microeconomics.

The *Economic Freedom of the World* index for 2013

Accurate measurement of economic freedom has always been the sole objective of the *Economic Freedom of the World* project. In recent years, social scientists have focused on identification and measurement of the impact of economic, political, legal, and cultural factors on the growth and development of economies. The EFW data set provides the most comprehensive measure of the degree to which countries rely on voluntary exchange and market institutions to allocate resources. A quality measure of differences in economic freedom across countries and over time is essential for the ongoing scholarly research in this important area.

The EFW index now covers 157 countries with data available for approximately 100 countries back to 1980. This data set enables scholars to analyze the impact of both cross-country differences in economic freedom and changes in that freedom across a time frame of more than three decades. The EFW measure will also help scholars examine the contribution of economic institutions more thoroughly and better disentangle it from political, climatic, locational, cultural, and historical factors as determinants of growth and development.

The construction of the index published in *Economic Freedom of the World* is based on three important methodological principles. First, objective components are always preferred to those that involve surveys or value judgments. Given the multi-dimensional nature of economic freedom and the importance of legal and regulatory elements, it is sometimes necessary to use data based on surveys, expert panels, and generic case studies. To the fullest extent possible, however, the index uses objective components. Second, the data used to construct the index ratings are from external sources such as the International Monetary Fund, World Bank, and World Economic Forum that provide data for a large number of countries. Data provided directly from a source within a country are rarely used. Importantly, the value

judgments of the authors or others in the Economic Freedom Network are never used to alter the raw data or the rating of any country. Third, transparency is present throughout. The report provides information about the data sources, the methodology used to transform raw data into component ratings, and how the component ratings are used to construct both the area and summary ratings. Methodological details can be found in the Appendix: Explanatory Notes and Data Sources of this report. The entire data set used in the construction of the index is freely available to researchers at <freetheworld.com>.

Structure of the EFW index

Exhibit 1.1 indicates the structure of the EFW index. The index measures the degree of economic freedom present in five major areas: [1] Size of Government; [2] Legal System and Security of Property Rights; [3] Sound Money; [4] Freedom to Trade Internationally; [5] Regulation.

Within the five major areas, there are 24 components in the index. Many of those components are themselves made up of several sub-components. In total, the index comprises 42 distinct variables. Each component and sub-component is placed on a scale from 0 to 10 that reflects the distribution of the underlying data. When sub-components are present, the sub-component ratings are averaged to derive the component rating. The component ratings within each area are then averaged to derive ratings for each of the five areas. In turn, the five area ratings are averaged to derive the summary rating for each country. The following section provides an overview of the five major areas.

1 *Size of Government*

The four components of Area 1 indicate the extent to which countries rely on the political process to allocate resources and goods and services. When government spending increases relative to spending by individuals, households, and businesses, government decision-making is substituted for personal choice and economic freedom is reduced. The first two components address this issue. Government consumption as a share of total consumption (1A) and transfers and subsidies as a share of GDP (1B) are indicators of the size of government. When government consumption is a larger share of the total, political choice is substituted for personal choice. Similarly, when governments tax some people in order to provide transfers to others, they reduce the freedom of individuals to keep what they earn.

The third component (1C) in this area measures the extent to which countries use private investment and enterprises rather than government investment and firms to direct resources. Governments and state-owned enterprises play by rules that are different from those to which private enterprises are subject. They are not dependent on consumers for their revenue or on investors for capital. They often operate in protected markets. Thus, economic freedom is reduced as government enterprises produce a larger share of total output.

The fourth component (1D) is based on (1Di) the top marginal income tax rate and (1Dii) the top marginal income and payroll tax rate and the income threshold at which these rates begin to apply. These two sub-components are averaged to calculate the top marginal tax rate (1D). High marginal tax rates that apply at relatively low income levels are also indicative of reliance upon government. Such rates deny individuals the fruits of their labor. Thus, countries with high marginal tax rates and low income thresholds are rated lower.

Exhibit 1.1: Areas, Components, and Sub-components of the EFW Index

1. Size of Government

- | | |
|---|---|
| <ul style="list-style-type: none"> A. Government consumption B. Transfers and subsidies C. Government enterprises and investment | <ul style="list-style-type: none"> D. Top marginal tax rate <ul style="list-style-type: none"> (i) Top marginal income tax rate (ii) Top marginal income and payroll tax rate |
|---|---|
-

2. Legal System and Property Rights

- | | |
|---|---|
| <ul style="list-style-type: none"> A. Judicial independence B. Impartial courts C. Protection of property rights D. Military interference in rule of law and politics E. Integrity of the legal system | <ul style="list-style-type: none"> F. Legal enforcement of contracts G. Regulatory costs of the sale of real property H. Reliability of police I. Business costs of crime |
|---|---|
-

3. Sound Money

- | | |
|---|--|
| <ul style="list-style-type: none"> A. Money growth B. Standard deviation of inflation | <ul style="list-style-type: none"> C. Inflation: most recent year D. Freedom to own foreign currency bank accounts |
|---|--|
-

4. Freedom to Trade Internationally

- | | |
|--|---|
| <ul style="list-style-type: none"> A. Tariffs <ul style="list-style-type: none"> (i) Revenue from trade taxes (% of trade sector) (ii) Mean tariff rate (iii) Standard deviation of tariff rates B. Regulatory trade barriers <ul style="list-style-type: none"> (i) Non-tariff trade barriers (ii) Compliance costs of importing and exporting | <ul style="list-style-type: none"> C. Black-market exchange rates D. Controls of the movement of capital and people <ul style="list-style-type: none"> (i) Foreign ownership / investment restrictions (ii) Capital controls (iii) Freedom of foreigners to visit |
|--|---|
-

5. Regulation

- | | |
|--|---|
| <ul style="list-style-type: none"> A. Credit market regulations <ul style="list-style-type: none"> (i) Ownership of banks (ii) Private sector credit (iii) Interest rate controls / negative real interest rates B. Labor market regulations <ul style="list-style-type: none"> (i) Hiring regulations and minimum wage (ii) Hiring and firing regulations (iii) Centralized collective bargaining (iv) Hours regulations (v) Mandated cost of worker dismissal (vi) Conscription | <ul style="list-style-type: none"> C. Business regulations <ul style="list-style-type: none"> (i) Administrative requirements (ii) Bureaucracy costs (iii) Starting a business (iv) Extra payments / bribes / favoritism (v) Licensing restrictions (vi) Cost of tax compliance |
|--|---|

Taken together, the four components of Area 1 measure the degree to which a country relies on personal choice and markets rather than government budgets and political decision-making. Therefore, countries with low levels of government spending as a share of the total, a smaller government enterprise sector, and lower marginal tax rates earn the highest ratings in this area.

2 *Legal System and Property Rights*

Protection of persons and their rightfully acquired property is a central element of economic freedom and a civil society. Indeed, it is the most important function of government. Area 2 focuses on this issue. The key ingredients of a legal system consistent with economic freedom are rule of law, security of property rights, an independent and unbiased judiciary, and impartial and effective enforcement of the law. The nine components in this area are indicators of how effectively the protective functions of government are performed. These components are from three primary sources: the *International Country Risk Guide*, the *Global Competitiveness Report*, and the World Bank's *Doing Business* project.

Security of property rights, protected by the rule of law, provides the foundation for both economic freedom and the efficient operation of markets. Freedom to exchange, for example, is meaningless if individuals do not have secure rights to property, including the fruits of their labor. When individuals and businesses lack confidence that contracts will be enforced and the fruits of their productive efforts protected, their incentive to engage in productive activity is eroded. Perhaps more than any other area, this area is essential for the efficient allocation of resources. Countries with major deficiencies in this area are unlikely to prosper regardless of their policies in the other four areas.

3 *Sound Money*

Money oils the wheels of exchange. An absence of sound money undermines gains from trade. As Milton Friedman informed us long ago, inflation is a monetary phenomenon, caused by too much money chasing too few goods. High rates of monetary growth invariably lead to inflation. Similarly, when the rate of inflation increases, it also tends to become more volatile. High and volatile rates of inflation distort relative prices, alter the fundamental terms of long-term contracts, and make it virtually impossible for individuals and businesses to plan sensibly for the future. Sound money is essential to protect property rights and, thus, economic freedom. Inflation erodes the value of property held in monetary instruments. When governments finance their expenditures by creating money, they are, in effect, expropriating the property and violating the economic freedom of their citizens.

The important thing is that individuals have access to sound money: who provides it makes little difference. Thus, in addition to data on a country's rate of inflation and its government's monetary policy, it is important to consider how difficult it is to use alternative, more credible, currencies. If bankers can offer saving and checking accounts in other currencies or if citizens can open foreign bank accounts, then access to sound money is increased and economic freedom expanded.

There are four components to the EFW index in Area 3. All of them are objective and relatively easy to obtain and all have been included in the earlier editions of the index. The first three are designed to measure the consistency of monetary policy (or institutions) with long-term price stability. Component 3D is designed to measure the ease with which other currencies can be used via domestic and foreign

bank accounts. In order to earn a high rating in this area, a country must follow policies and adopt institutions that lead to low (and stable) rates of inflation and avoid regulations that limit the ability to use alternative currencies.

4 *Freedom to Trade Internationally*

In our modern world of high technology and low costs for communication and transportation, freedom of exchange across national boundaries is a key ingredient of economic freedom. Many goods and services are now either produced abroad or contain resources supplied from abroad. Voluntary exchange is a positive-sum activity: both trading partners gain and the pursuit of the gain provides the motivation for the exchange. Thus, freedom to trade internationally also contributes substantially to our modern living standards.

At the urging of protectionist critics and special-interest groups, virtually all countries adopt trade restrictions of various types. Tariffs and quotas are obvious examples of roadblocks that limit international trade. Because they reduce the convertibility of currencies, controls on the exchange rate also hinder international trade. The volume of trade is also reduced if the passage of goods through customs is onerous and time consuming. Sometimes these delays are the result of administrative inefficiency while in other instances they reflect the actions of corrupt officials seeking to extract bribes. In both cases, economic freedom is reduced.

The components in this area are designed to measure a wide variety of restraints that affect international exchange: tariffs, quotas, hidden administrative restraints, and controls on exchange rates and the movement of capital. In order to get a high rating in this area, a country must have low tariffs, easy clearance and efficient administration of customs, a freely convertible currency, and few controls on the movement of physical and human capital.

5 *Regulation*

When regulations restrict entry into markets and interfere with the freedom to engage in voluntary exchange, they reduce economic freedom. The fifth area of the index focuses on regulatory restraints that limit the freedom of exchange in credit, labor, and product markets. The first component (5A) reflects conditions in the domestic credit market. Sub-component 5Ai provides evidence on the extent to which the banking industry is privately owned. The final two sub-components indicate the extent to which credit is supplied to the private sector and whether controls on interest rates interfere with the market in credit. Countries that use a private banking system to allocate credit to private parties and refrain from controlling interest rates receive higher ratings for this regulatory component.

Many types of labor-market regulation infringe on the economic freedom of employees and employers. Among the more prominent are minimum wages, dismissal regulations, centralized wage setting, extension of union contracts to non-participating parties, and conscription. The labor-market component (5B) is designed to measure the extent to which these restraints upon economic freedom are present. In order to earn high marks in the component rating regulation of the labor market, a country must allow market forces to determine wages and establish the conditions of hiring and firing, and refrain from the use of conscription.

Like the regulation of credit and labor markets, the regulation of business activities (component 5C) inhibits economic freedom. The sub-components of 5C are

designed to identify the extent to which regulations and bureaucratic procedures restrain entry and reduce competition. In order to score high in this portion of the index, countries must allow markets to determine prices and refrain from regulatory activities that retard entry into business and increase the cost of producing products. They also must refrain from “playing favorites,” that is, from using their power to extract financial payments and reward some businesses at the expense of others.

Construction of Area and Summary ratings

Theory provides us with some direction regarding elements that should be included in the five areas and the summary index, but it does not indicate what weights should be attached to the components within the areas or among the areas in the construction of the summary index. It would be nice if these factors were independent of each other and a weight could be attached to each of them. In the past, we investigated several methods of weighting the various components, including principle component analysis and a survey of economists. We have also invited others to use their own weighting structure if they believe that it is preferable. Our experience indicates that the summary index is not very sensitive to alternative weighting methods.

Furthermore, there is reason to question whether the areas (and components) are independent or work together like the wheels, motor, transmission, driveshaft, and frame of a car. Just as these interconnected parts provide for the mobility of an automobile, it may be the combination of interrelated factors that brings about economic freedom. Which is more important for the mobility of an automobile: the motor, wheels, or transmission? The question cannot be easily answered because the parts work together. If any of these key parts break down, the car is immobile. Institutional quality may be much the same. If any of the key parts are absent, the overall effectiveness is undermined.

As the result of these two considerations, we organize the elements of the index in a manner that seems sensible to us but we make no attempt to weight the components in any special way when deriving either area or summary ratings. Of course, the component and sub-component data are available to researchers who would like to consider alternative weighting schemes and we encourage them to do so.

Summary Economic Freedom Ratings for 2013

Exhibits 1.2a and 1.2b present the summary economic freedom ratings, sorted from highest to lowest, for the 157 countries of this year’s report. These ratings are for 2013, the most recent year for which comprehensive data are available.

Hong Kong and Singapore, once again, occupy the top two positions. The other nations in the top 10 are New Zealand, Switzerland, United Arab Emirates, Mauritius, Jordan, Ireland, Canada, and the United Kingdom and Chile, tied for 10th. The rankings of some other major countries are Australia (12th), the United States (16th), Japan (26th), Germany (29th), South Korea (tied for 39th), Italy (tied for 68th), France (tied for 70th), Mexico (93rd), Russia (99th), China (tied for 111th), India (114th), and Brazil (tied for 118th). The 10 lowest-rated countries are: Angola, Zimbabwe, Central African Republic, Algeria, Argentina, Syria, Chad, Libya, Republic of Congo, and, lastly, Venezuela.

Exhibit 1.2a: Summary Economic Freedom Ratings for 2013, First and Second Quartiles

Exhibit 1.2b: Summary Economic Freedom Ratings for 2013, Third and Fourth Quartiles

The EFW index is calculated back to 1970 as the availability of data allows; see the Country Data Tables in chapter 2 or our website, <freetheworld.com>, for information from past years. Because some data for earlier years may have been updated or corrected, researchers are always encouraged to use the data from the most recent annual report to assure the most reliable figures.

Area Economic Freedom Ratings (and Rankings) for 2013

Exhibit 1.3 presents the ratings (and rankings) for each of the five areas of the index and for Components 5A, 5B, and 5C. A number of interesting patterns emerge from an analysis of these data. High-income industrial economies generally rank quite high for Legal System and Property Rights (Area 2), Sound Money (Area 3), and Freedom to Trade Internationally (Area 4). Their ratings were lower, however, for Size of Government (Area 1) and Regulation (Area 5). This was particularly true for western European countries.

On the other hand, a number of developing nations have a small fiscal size of government but rate low in other areas and, as a result, have a low overall rating. The lesson from this is clear: a small fiscal size of government is insufficient to ensure economic freedom. The institutions of economic freedom, such as the rule of law and property rights, as well as sound money, trade openness, and sensible regulation are also required.

Weakness in the rule of law and property rights is particularly pronounced in sub-Saharan Africa, among Islamic nations, and for several nations that were formerly part of the Soviet bloc, though several countries in the latter group have made impressive strides toward improvement. Many nations in Latin America and Southeast Asia also score poorly for rule of law and property rights. The nations that rank poorly in this category also tend to score poorly in the trade and regulation areas, even though several have reasonably sized governments and sound money.

The Chain-Linked Summary Index

Through time, the index has become more comprehensive and the available data more complete. As a result, the number and composition of the components for many countries varies across time. This presents a problem similar to that confronted when calculating GDP or a price index over time when we know that the underlying bundle of goods and services is changing from one year to another. In order to correct for this problem and assure comparability across time, we have done the same thing that statisticians analyzing national income do: we have chain-linked the data.

The base year for the chain-link index is 2000, and as a result the chain-link index is not available for any countries added since that year. Changes in a country's chain-linked index through time are based only on changes in components that were present in adjoining years. For example, the 2010 chain-linked rating is based on the 2009 rating but is adjusted based on the changes in the underlying data between 2009 and 2010 for those components that were present in both years. If the common components for a country in 2010 were the same as in 2009, then no adjustment was made to the country's 2010 summary rating. However, if the 2010

Exhibit 1.3: Area Economic Freedom Ratings (Rankings) for 2013

Ratings are shown rounded to the nearest tenth of a point, but the rankings are based on the unrounded ratings.

components were lower than those for 2009 for the components present in both years, then the country's 2010 summary rating was adjusted downward proportionally to reflect this fact. Correspondingly, in cases where the ratings for the common components were higher in 2010 than for 2009, the country's 2010 summary rating was adjusted upward proportionally. The chain-linked ratings were constructed by repeating this procedure backward in time to 1970 and forward in time to 2013.

The chain-linked methodology means that a country's rating will change across time periods only when there is a change in ratings for components present during adjacent years. This is precisely what one would want when making comparisons across time periods.

Average chain-linked economic freedom ratings

Exhibit 1.4 shows the average chain-linked economic freedom rating for the 102 countries with continuous ratings since 1980. The average level of economic freedom, as measured by this chain-linked EFW index, has increased from 5.31 in 1980 to 5.77 in 1990 before jumping to 6.74 in 2000 and finally to 6.86 in 2013. The global average increased slightly this past year.

Exhibit 1.4 indicates that, on average, the world is more economically free today than it was three decades ago. However, most of the increase took place during the 1980s and 1990s. The 6.86 average rating for 2013 is only slightly higher than the 6.74 figure for 2000. The major factors contributing to the long-term increase in economic freedom were reductions in marginal income-tax rates, more stable monetary policy, a decline in the use of military conscription, and liberalization of trade policies.

Exhibit 1.5 shows the chain-linked summary ratings for all years. Researchers conducting long-term studies should use the chain-linked data.

Exhibit 1.4: Average Chain-linked EFW Rating for the 101 countries with ratings since 1980

The declining economic freedom of the United States¹

While economic freedom has generally risen globally since 1980, there has been a modest reversal of the trend since 2000. For example, the average rating for the original OECD nations has fallen by 0.26 of a point since 2000. Nowhere has the reversal of the rising trend in the economic freedom been more evident than in the United States. Throughout the period from 1970 to 2000, the United States ranked as the world's freest OECD nation (generally the third freest economy overall behind only Hong Kong and Singapore). The chain-linked summary rating of the United States in 2000 was 8.65. By 2005, the US rating had slipped to 8.22. The slide has continued. The 7.73 chain-linked rating of the United States in 2013 was more than 0.9 of a unit lower than the 2000 rating. Thus, the decline in economic freedom in the United States has been more than three times greater than the average decline found in the OECD.

The 0.9-point decline in the summary rating between 2000 and 2013 on the 10-point scale of the index may not sound like much, but scholarly work on this topic indicates that a one-point decline in the EFW rating is associated with a reduction in the long-term growth of GDP of between 1.0 and 1.5 percentage points annually (Gwartney, Holcombe, and Lawson, 2006). This implies that, unless policies undermining economic freedom are reversed, the future annual growth of the US economy will be only about half its historic average of 3%.

What accounts for the US decline? While the US ratings and rankings have fallen in all five areas of the EFW index, the reductions have been largest in the Legal System and Protection of Property Rights (Area 2), Freedom to Trade Internationally (Area 4), and Regulation (Area 5). The plunge in Area 2 has been particularly alarming. In 2000, 9.23 was the Area 2 rating for the United States but by 2013 the US rating in this area had plummeted to 6.95. While it is difficult to pinpoint the precise reason for this decline, it is clear that the increased use of eminent domain to transfer property to powerful political interests, the ramifications of the wars on terrorism and drugs, and the violation of the property rights of bondholders in the auto-bailout case have weakened the US tradition of rule of law. These factors surely contributed to the sharp decline in the legal system area.

¹ This section draws heavily from Lawson, 2015.

Expanded use of regulation has also been an important contributing factor to the rating reductions of the United States. During the past decade, non-tariff trade barriers, restrictions on foreign investment, and business regulation have all grown extensively. The expanded use of regulation in the United States has resulted in sharp rating reductions for components such as independence of the judiciary, impartiality of the courts, and regulatory favoritism. To a large degree, the United States has experienced a significant move away from rule of law and toward a highly regulated, politicized, and heavily policed state.

Looking at some of the components of Area 2 provides some insight. The declines in several of the components are quite remarkable. For example, the measures for Judicial Independence (2A) and Impartial Courts (2B) have respectively fallen to values of 6.8 and 6.1 in 2013, down from 8.0 and 9.0 in 2000. Could the expanded use of secret Foreign Intelligence Surveillance Courts (FISA Courts), where government requests are rubber stamped nearly 100% of the time be responsible for this? Similarly, how much did the interference of the executive branch of the federal government in the bankruptcy proceedings of General Motors and Chrysler contribute to the decline?

Component 2C (Property Rights) has fallen to 7.2 from 9.1. Could the cause be the Supreme Court's notorious *Kelo v. City of New London* decision in 2005 that made it easier to condemn private property and transfer that property to politically connected private interests? And how about the expansion in civil asset forfeitures, in which the government can take your property without any proof of guilt, in prosecuting the war on drugs—was this a contributing factor? Could increasing environmental, safety, and health rules and new acts like Sarbanes-Oxley, Dodd-Frank, and the Affordable Care Act be seen as a threat to property rights?

Component 2D (Military Interference in the Political Process) has fallen to 6.7 from 10. Could the growth of the political power of the military and military contractors (for example, Halliburton) be driving this? Or could the fact that local police officers now sport armored cars, assault rifles, and body armor and look more like soldiers at war than cops keeping the peace (Balko, 2013) be a factor? Could the nationalization of airport security by TSA agents be responsible? The answer to all these questions is likely to be “yes”. We will never know which of these various factors figure most prominently in the construction of these ratings. However, whatever the underlying causes, when multiple indicators from different sources each using very different methods arrive at the same conclusion, we should take the results very seriously. It is clear in the data that property rights and the rule of law are under attack in the United States.

Economic freedom and human progress

As is customary, this chapter concludes with some simple graphs illustrating relationships between economic freedom and various other indicators of human and political progress. The graphs use the average of the chain-linked EFW index for the period from 1990 to 2013, breaking the data into four quartiles ordered from low to high. Because persistence is important and the impact of economic freedom will be felt over a lengthy time period, it is better to use the average rating over a fairly long time span rather than the current rating to observe the impact of economic freedom on performance.

The graphs begin with the data on the relationship between economic freedom and the level of per-capita GDP and economic growth. In recent years, numerous scholarly studies have analyzed these relationships in detail and, almost without exception, have found that countries with higher and improving economic freedom grow more rapidly and achieve higher levels of per-capita GDP (see Hall and Lawson, 2014).

Many of the relationships illustrated in the graphs below reflect the impact of economic freedom as it works through increasing economic growth. In other cases, the observed relationships may reflect the fact that some of the variables that influence economic freedom may also influence political factors like trust, honesty in government, and protection of civil liberties. Thus, we are not necessarily arguing that there is a direct causal relation between economic freedom and the variables considered below. In other words, these graphics are no substitute for real, scholarly investigation that controls for other factors. Nonetheless, we believe that the graphs provide some insights about the contrast between the nature and characteristics of market-oriented economies and those dominated by government regulation and planning. At the very least, these figures suggest potential fruitful areas for future research.

Exhibit 1.6: Economic Freedom and Income per Capita

Countries with more economic freedom have substantially higher per-capita incomes.

Note: Income = GDP per capita, (PPP constant 2011 US\$), 2013.

Sources: Fraser Institute, *Economic Freedom of the World: 2014 Annual Report*; World Bank, *World Development Indicators*.

Exhibit 1.7: Economic Freedom and Economic Growth

Countries with more economic freedom tend to grow more rapidly.

Note: The growth data were adjusted to control for the initial level of income.

Sources: Fraser Institute, *Economic Freedom of the World: 2014 Annual Report*; World Bank, *World Development Indicators*.

Exhibit 1.8: Economic Freedom and the Income Share of the Poorest 10%

The share of income earned by the poorest 10% of the population is unrelated to economic freedom.

Sources: Fraser Institute, *Economic Freedom of the World: 2014 Annual Report*; World Bank, *World Development Indicators*.

Exhibit 1.9: Economic Freedom and the Income Earned by the Poorest 10%

The amount of income, as opposed to the share, earned by the poorest 10% of the population is much higher in countries with higher economic freedom.

Note: Annual income per capita of poorest 10% (PPP constant 2011 US\$), 2013
 Sources: Fraser Institute, *Economic Freedom of the World: 2014 Annual Report*; World Bank, *World Development Indicators*.

Exhibit 1.10: Economic Freedom and Life Expectancy

Life expectancy is about 20 years longer in countries with the most economic freedom than in countries with the least.

Data available to researchers

The full data set, including all of the data published in this report as well as data omitted due to limited space, can be downloaded for free at <<http://www.freetheworld.com>>. The data file available there contains the most up-to-date and accurate data for the Economic Freedom of the World index. Some variable names and data sources have evolved over the years since the first publication in 1996; users should consult earlier editions of *Economic Freedom of the World* for details regarding sources and descriptions for those years. All editions of the report are available in PDF and can be downloaded for free at <<http://www.freetheworld.com>>. However, users are always strongly encouraged to use the data from this most recent data file as updates and corrections, even to earlier years' data, do occur. Users doing long-term or longitudinal studies are encouraged to use the chain-linked index as it is the most consistent through time.

If you have difficulty downloading the data, please contact Fred McMahon via e-mail to <freetheworld@fraserinstitute.org>. If you have technical questions about the data itself, please contact Joshua Hall <joshua.c.hall@gmail.com> or Robert Lawson <robert.a.lawson@gmail.com>. Please cite the data in your bibliography as:
